Presentation Outline

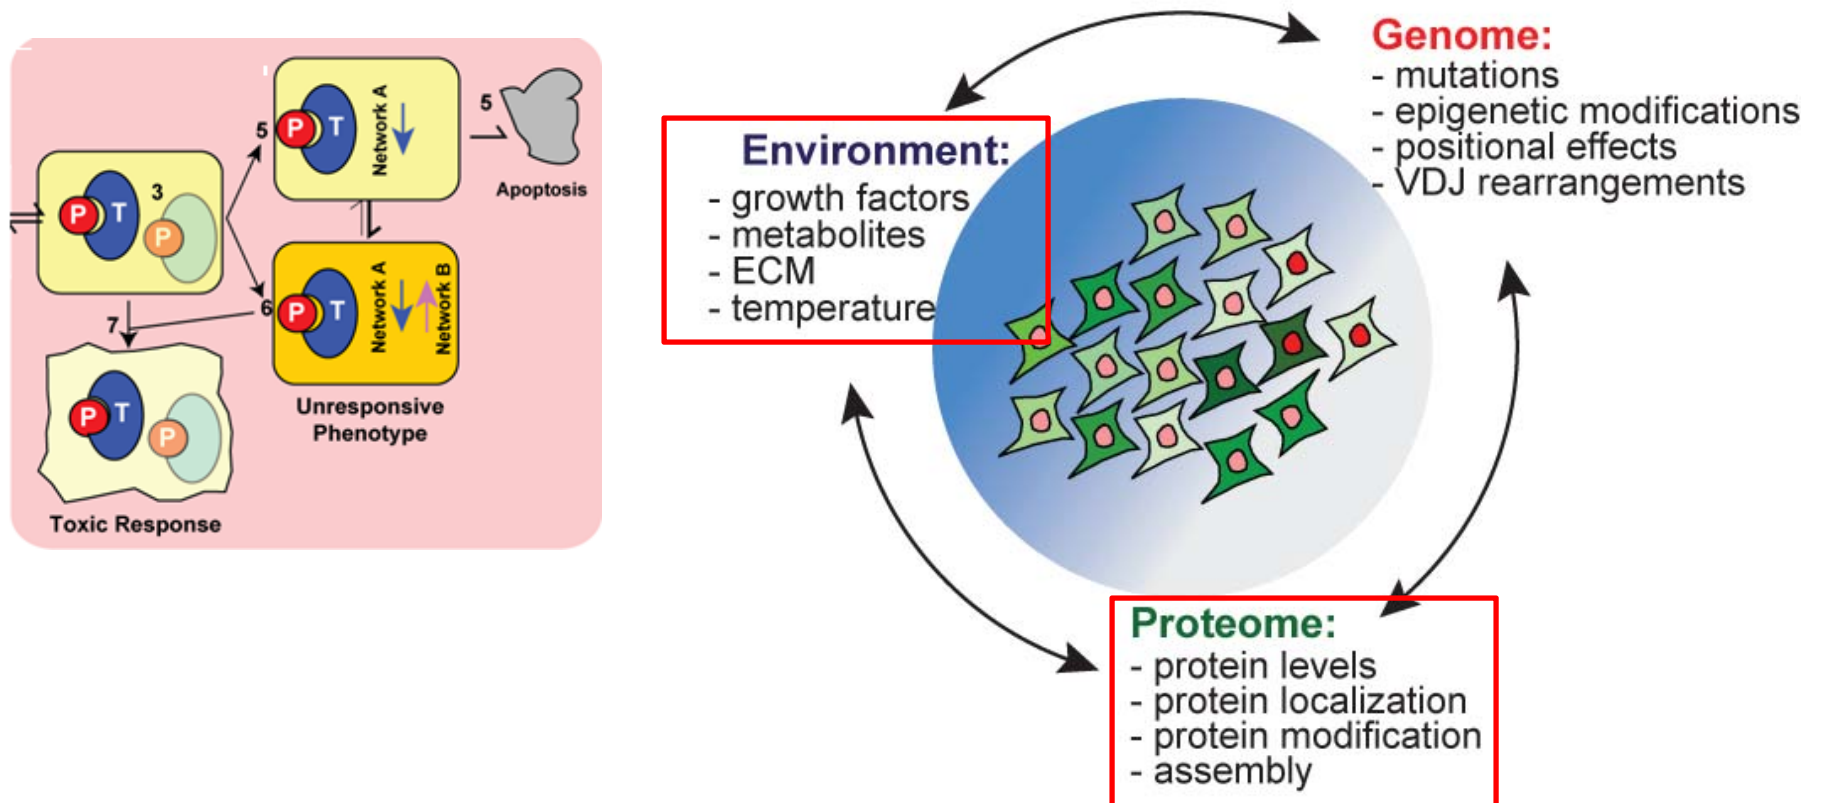

- ***Goals***
- ***Approach***
- ***Research Vignette I:***
 - ***Perturbagen dose-response***
- ***Research Vignette II:***
 - ***Perturbagen Predictors***
- ***Summary***

Cellular Response To Perturbation

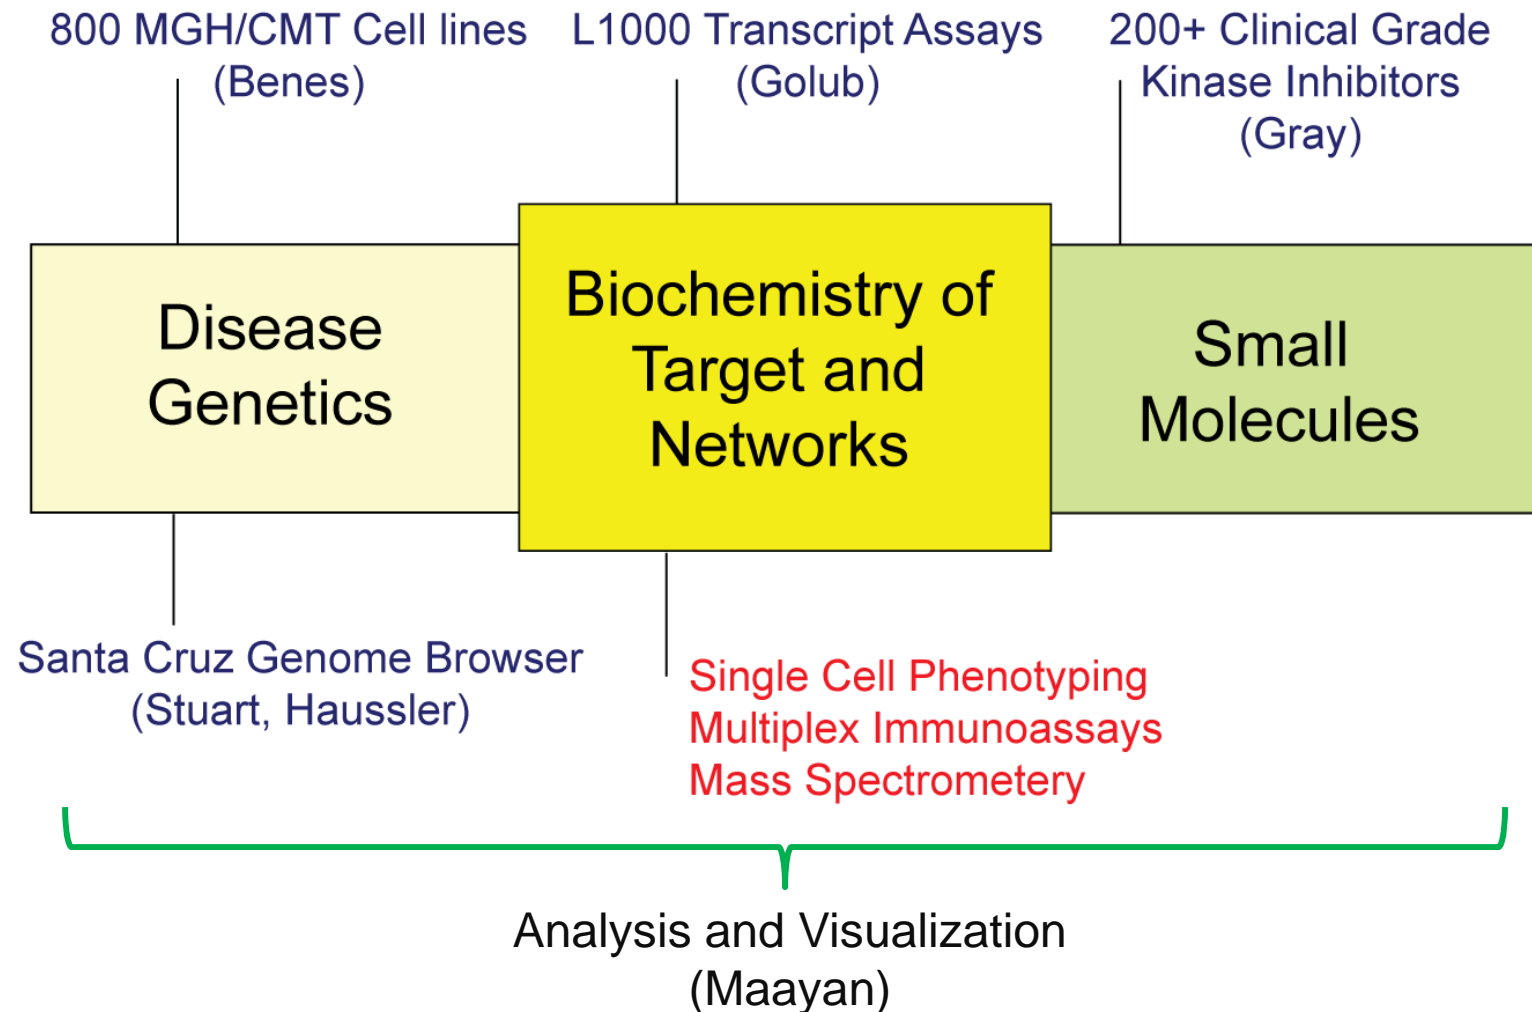

Simple view of drug response determinants

Factors that contribute to heterogeneity in response to perturbation

Transcription L1000 Assays

Multi-drug, multi-cell line dose response

Drug Properties

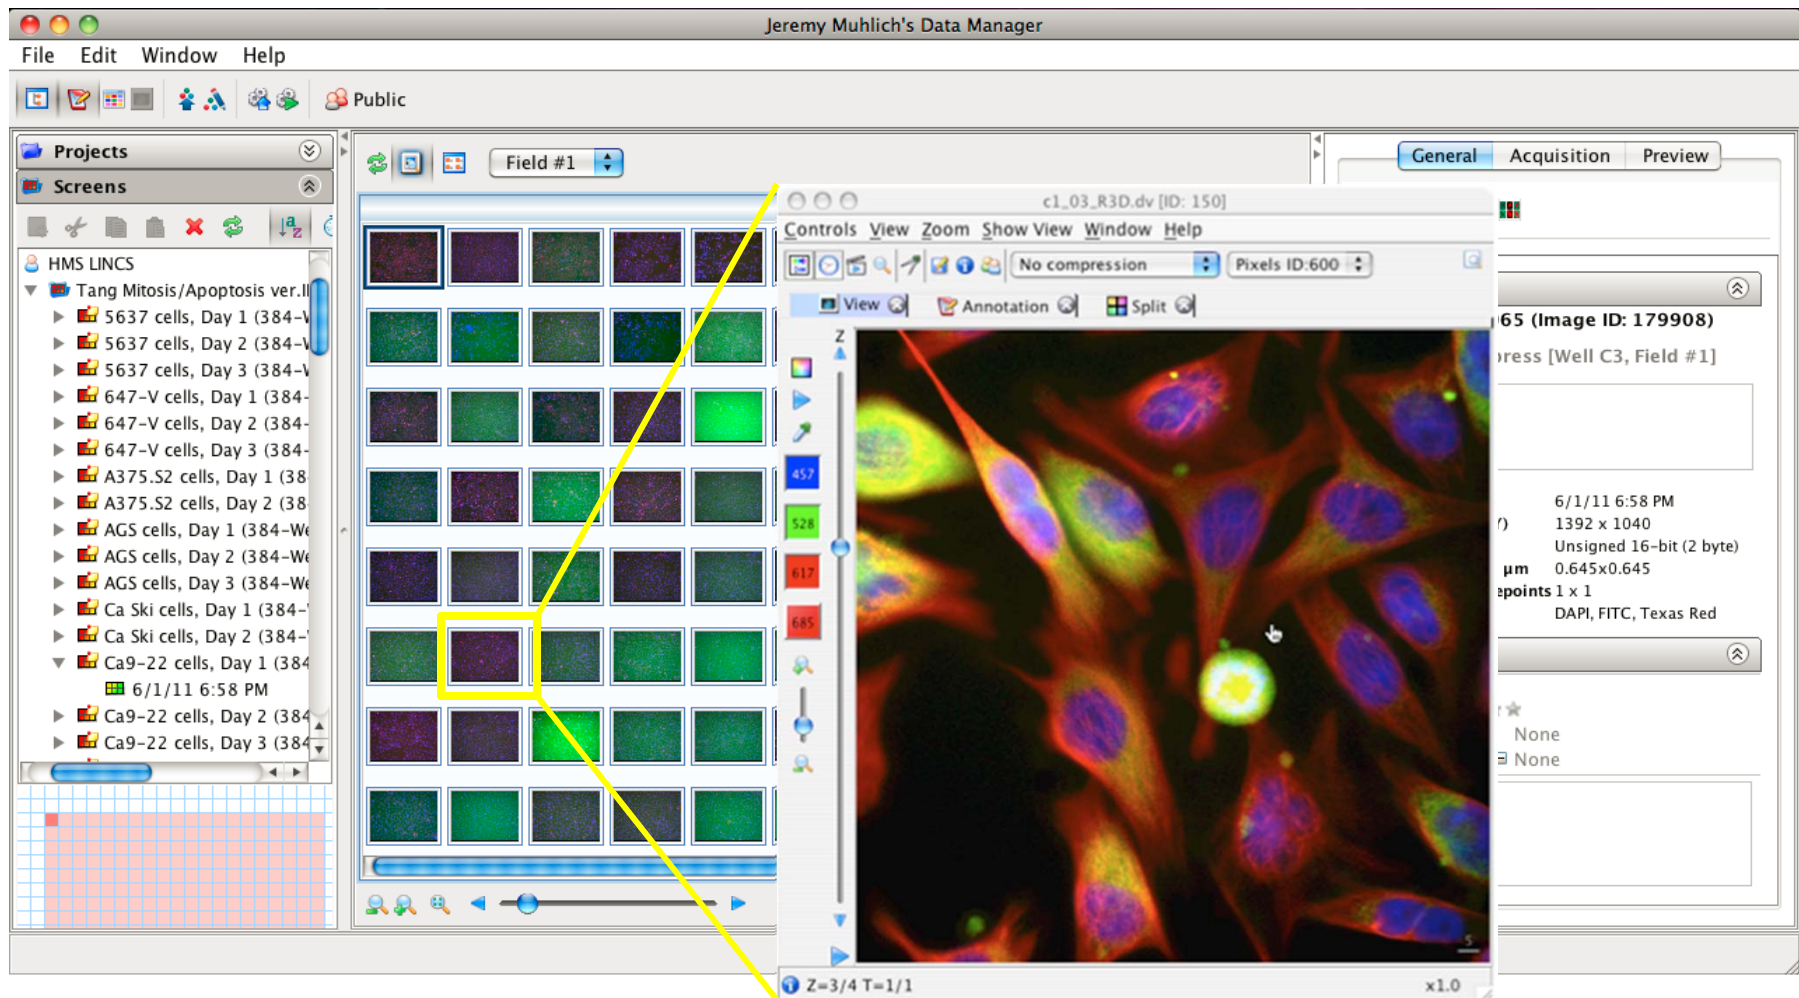

Drug selectivity

The KINOMEScan and mass spec
with Steve Gygi

Extensive single-cell and time resolved data - *Demo 4*

Goals

1. DATA

*Multiplex biochemical, phenotypic and **transcriptional** data on cellular response to perturbation:*

Focus on clinical grade kinase inhibitors

Across banks of genomically characterized cancer lines

Apply to diseases other than cancer and normal cells:

Stem cells, hepatocytes, cardiomyocytes

Rheumatoid arthritis, mitochondrial disease,

2. TOOLS

To compute perturbagen-response signatures:

Model complexity of response with dose, time and space

Develop network-level mathematical models:

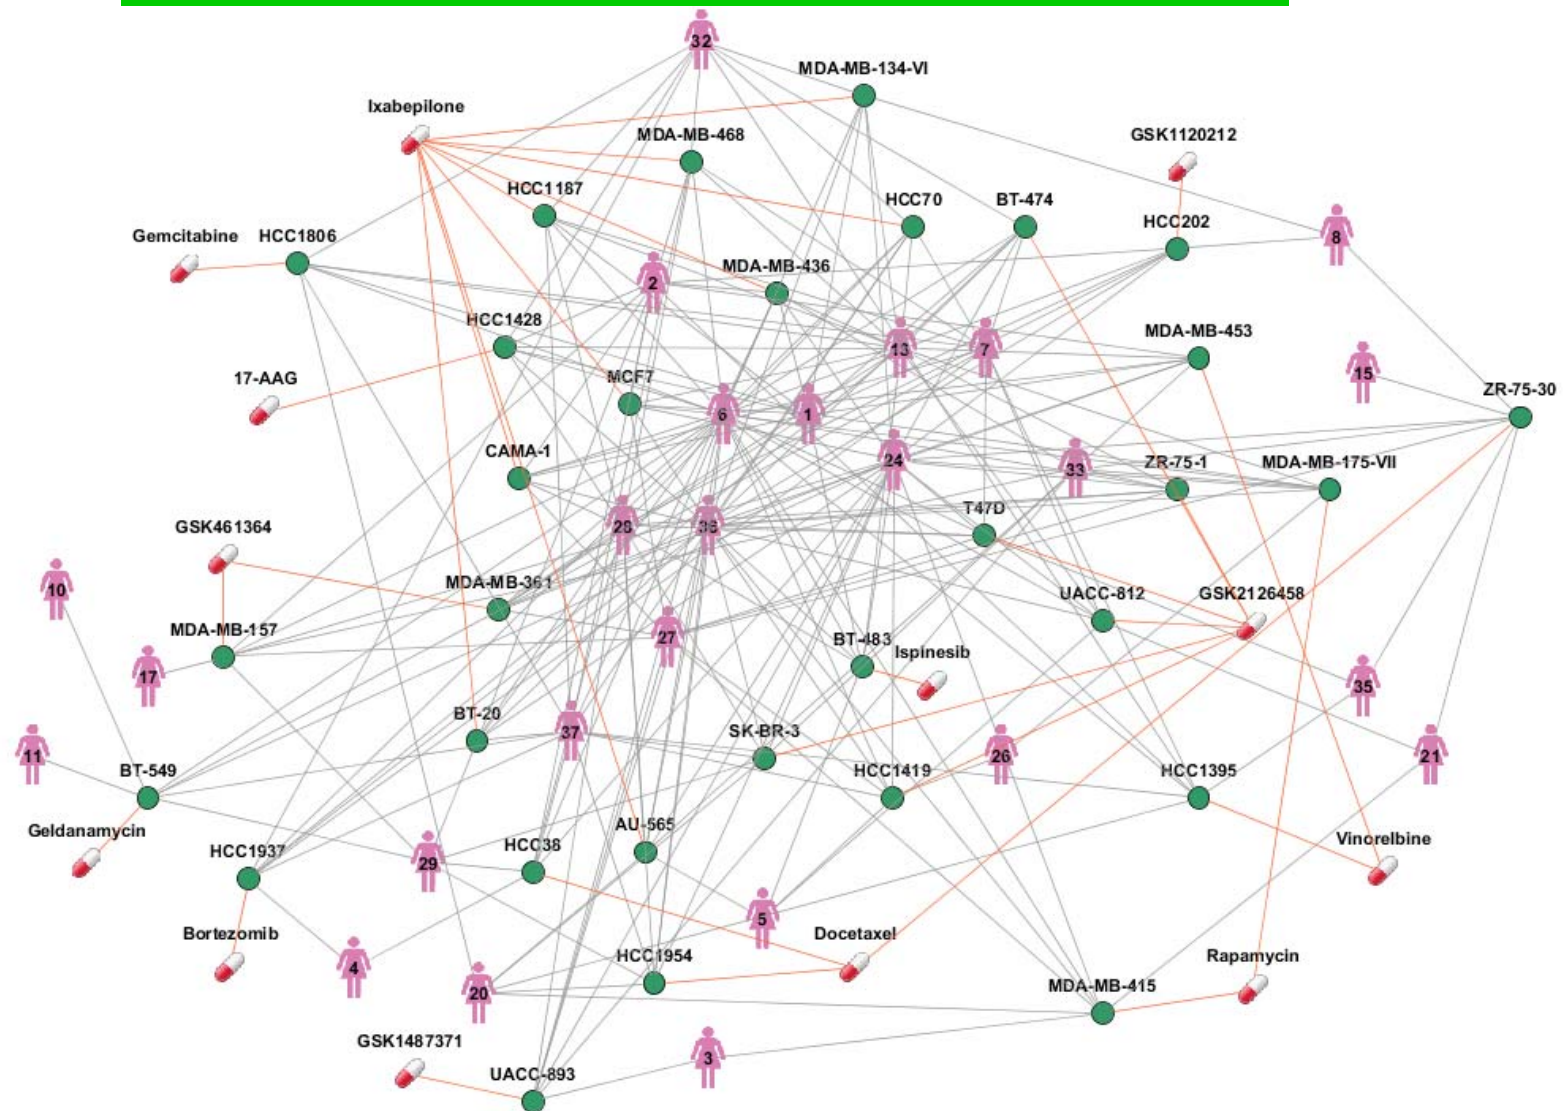

3. ACCESS

Disseminate diverse data and models:

Date and metadata standards – publication process

Papers on use cases and applications

Predicting perturbagen response in cell lines: no cell line like a patient but panel covers the landscape

Cells Currently Under Analysis

1. 70 Breast Cancer cell lines (NCI-ICBP45 set)
2. 30 Melanoma lines and other BRAF-V600E tumors
3. 10 Liver Cancer (HCC) Cell lines
4. 8 Lines with mitochondrial disease alleles (V. Mootha)
5. 8 Normal and rheumatoid arthritis synovial fibroblasts (BI)
6. Stem-cell derived cardiomyocytes (GE)
7. Differentiated and undifferentiated stem cells (HSCI)

Diverse user interfaces emphasizing pathways- *Demo 7*

LINCS

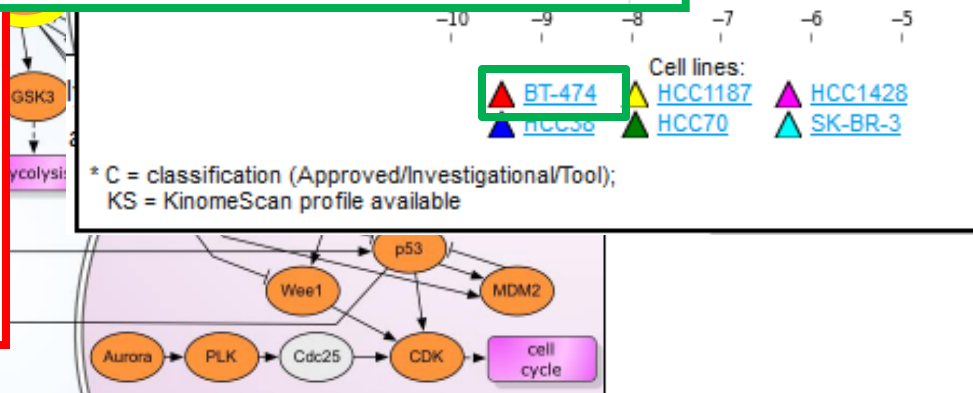

EXPLORE

DATA

Cell Information

Cell Name:	BT-474
Alternate Names:	
Alternate ID:	MGH:420; COSMIC:946359
Center Name:	HMS
Facility ID:	50106
Provider Name:	ATCC
Provider Catalog ID:	HTB-20

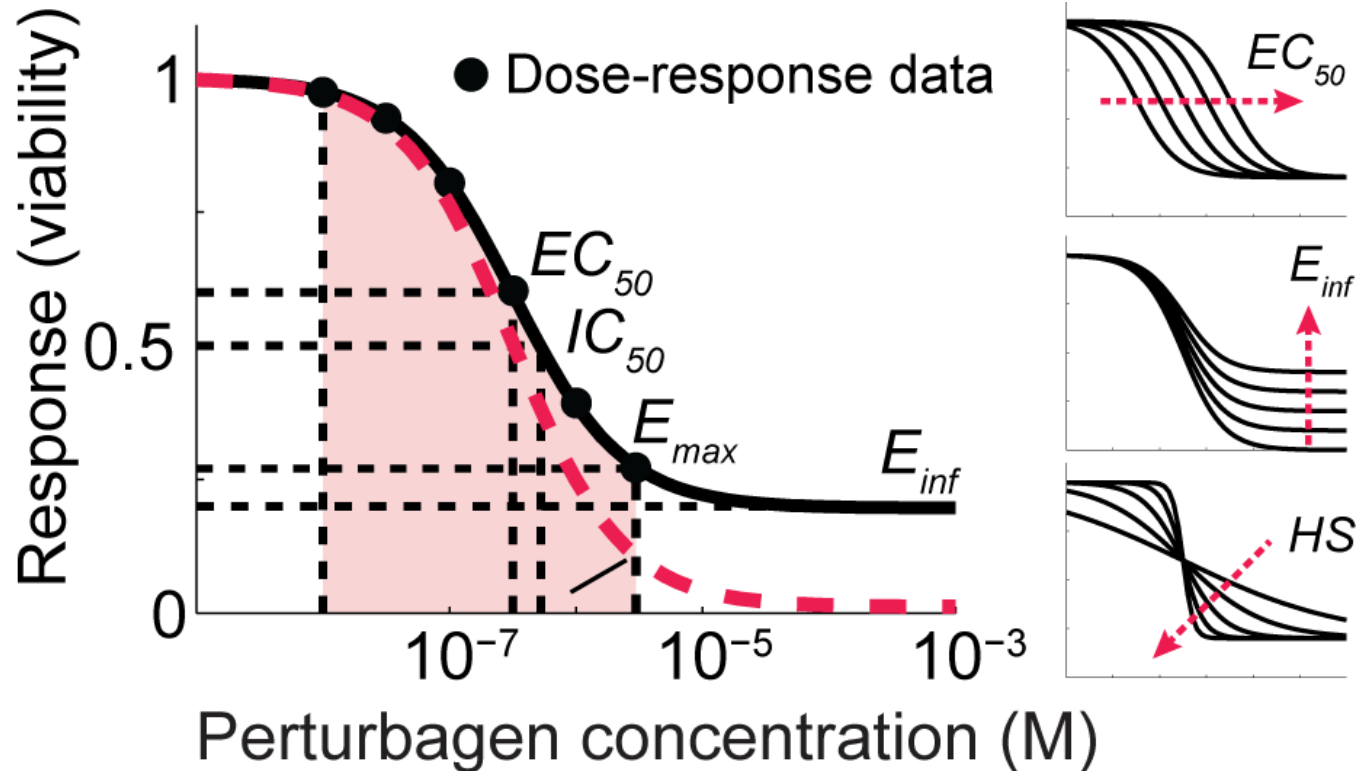

* C = classification (Approved/Investigational/Tool);
KS = KinomeScan profile available

Research Vignette I:

Perturbagen dose-response

Parameterizing a canonical dose-response curve

$$y = E_{\infty} + \left(\frac{E_0 - E_{\infty}}{1 + \left(\frac{D}{EC_{50}} \right)^{HS}} \right)$$

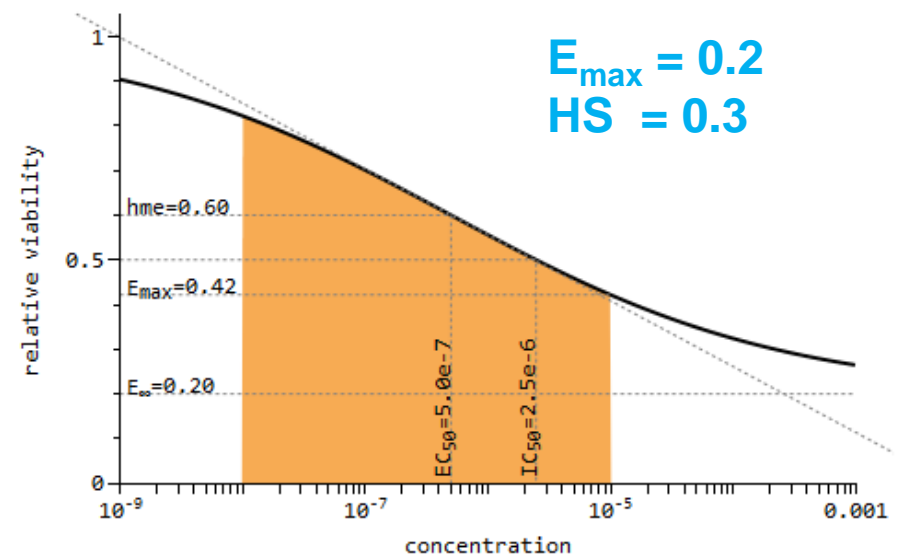

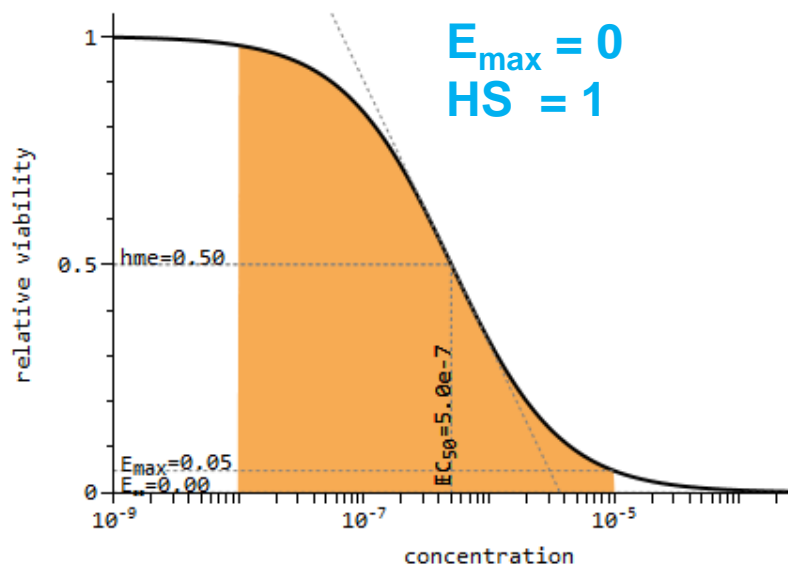

Extensive variation for parameters other than IC₅₀

Examples of different types variation

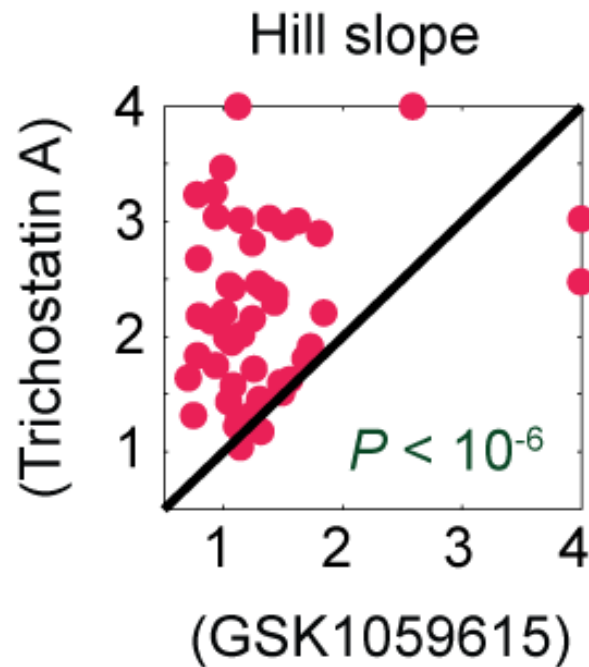

On-line exploration of dose-response curves - *Demo 7*

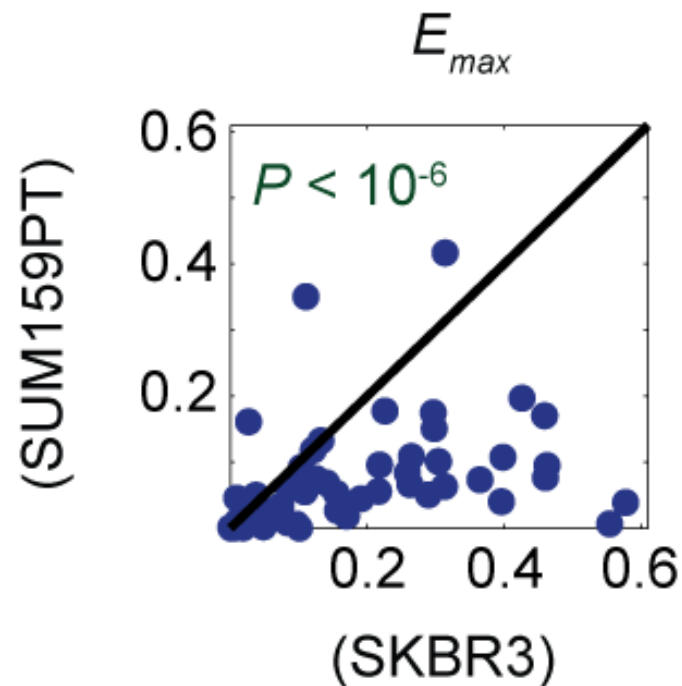

Variation can be associated either with perturbation or cell line (by mutual information)

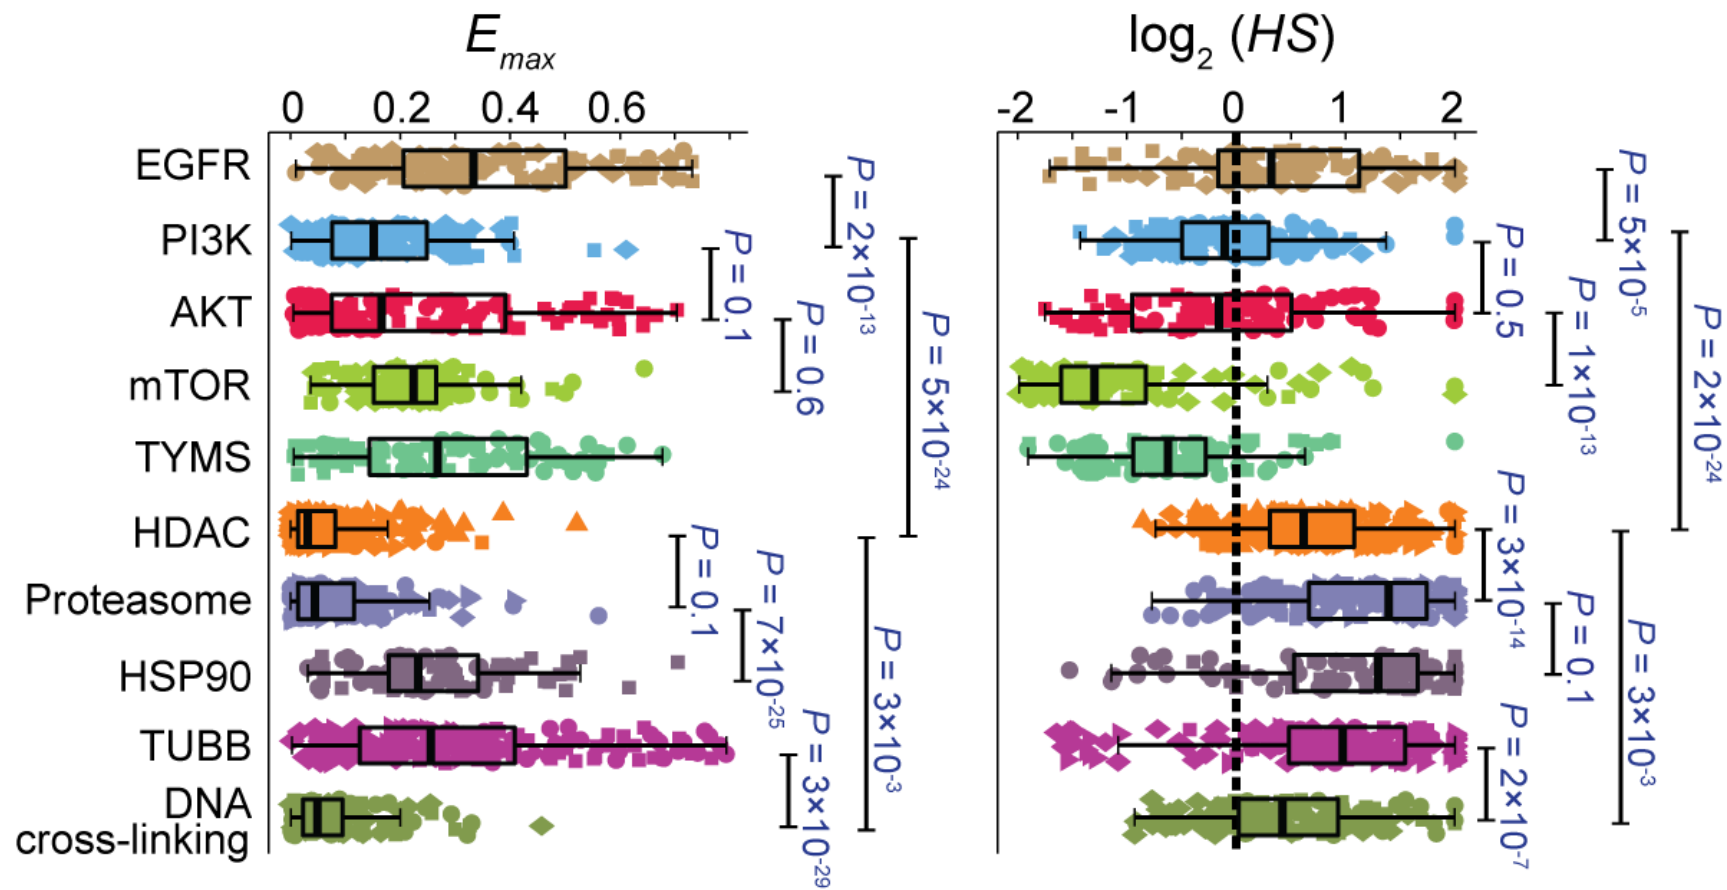

Association with Drug

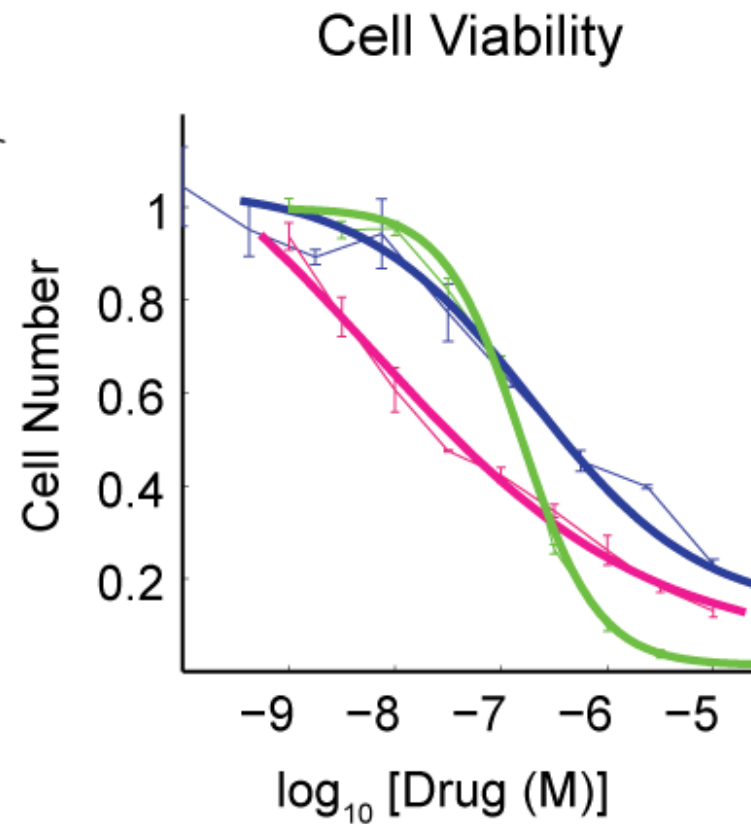

Association with Cell Line

Type of variation is common across a perturbagen class

Probing origins of variation in E_{\max} and Hill Slope

HCC1954 Her2+ Breast Cancer Cells

Hill slope is lowest when cell-to-cell variation is highest (poster 15)

Cell-to-cell variability: origin of fractional response?

Cell-to-cell variability likely to have significant dynamic component (Gefitinib at ~ 0.2 Cmax)

Research Vignette II:

Perturbagen Predictors

Determining the information content of perturbation profiles

Measure

Biochemical profile:
Basal Cell State
Ligand Perturbed State

Predict

Phenotype (viability):
Drug Perturbed State

Measurement on ~40 breast cancer lines Prediction for 40 drugs

Measure

Biochemical assays – 0 – 90 min

24 Growth factors
and Cytokines
X 2 concentrations

20 receptor Tyrosine
Kinases
phospho and total

4 immediate-early
signaling kinases
X 4 time-points

Pending:

*Additional signaling kinases
Transcriptional responses
Additional cell lines
Additional drugs*

Predict

**Viability
(day 3)**

**40 targeted
anti-cancer
drugs**

Heiser et al., 2012
PNAS, 109(8):2724

Overall data set ~ 3×10^5 unique biochemical measurements

Correlations between protein levels and activity are rare

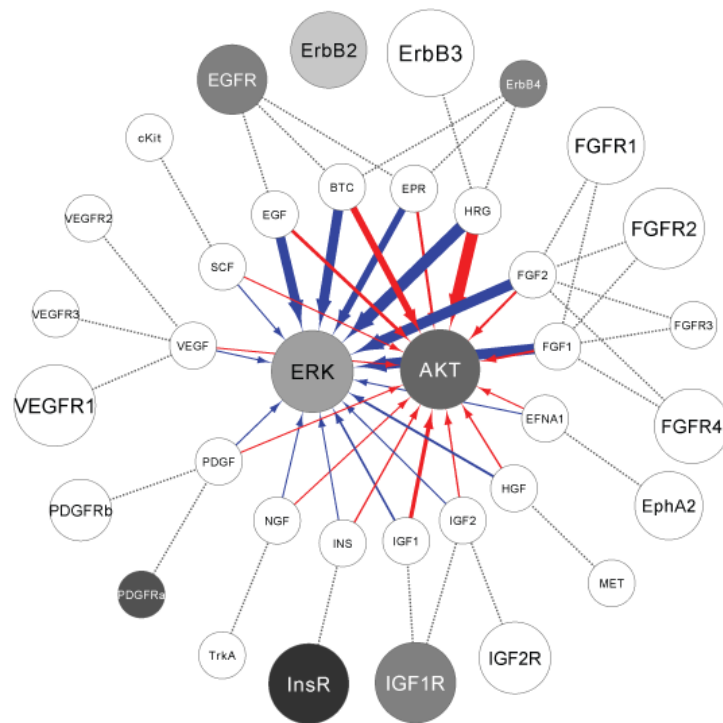

Receptor profiles cluster by clinical subtype - with further subdivision (of Her2^{amp} lines)

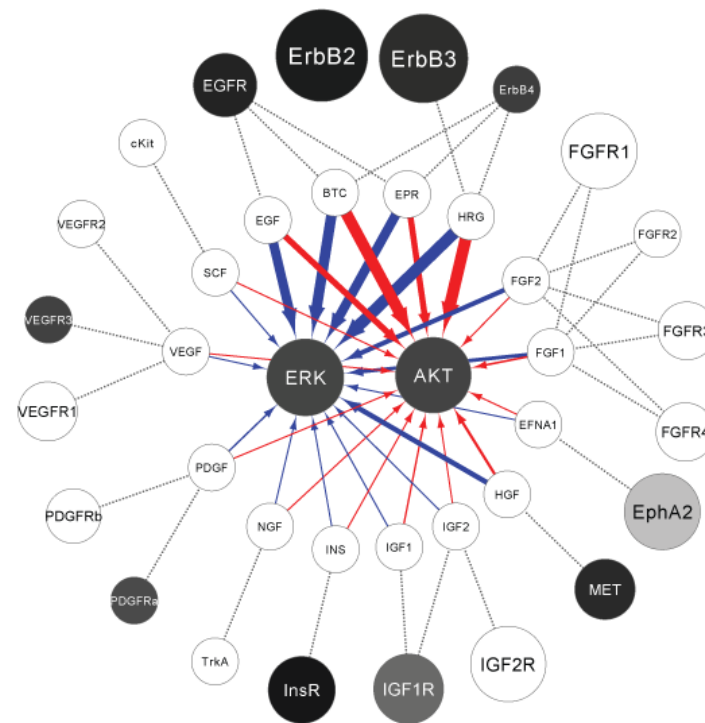

Clustering generates prototypical cell classes

Cluster SCII

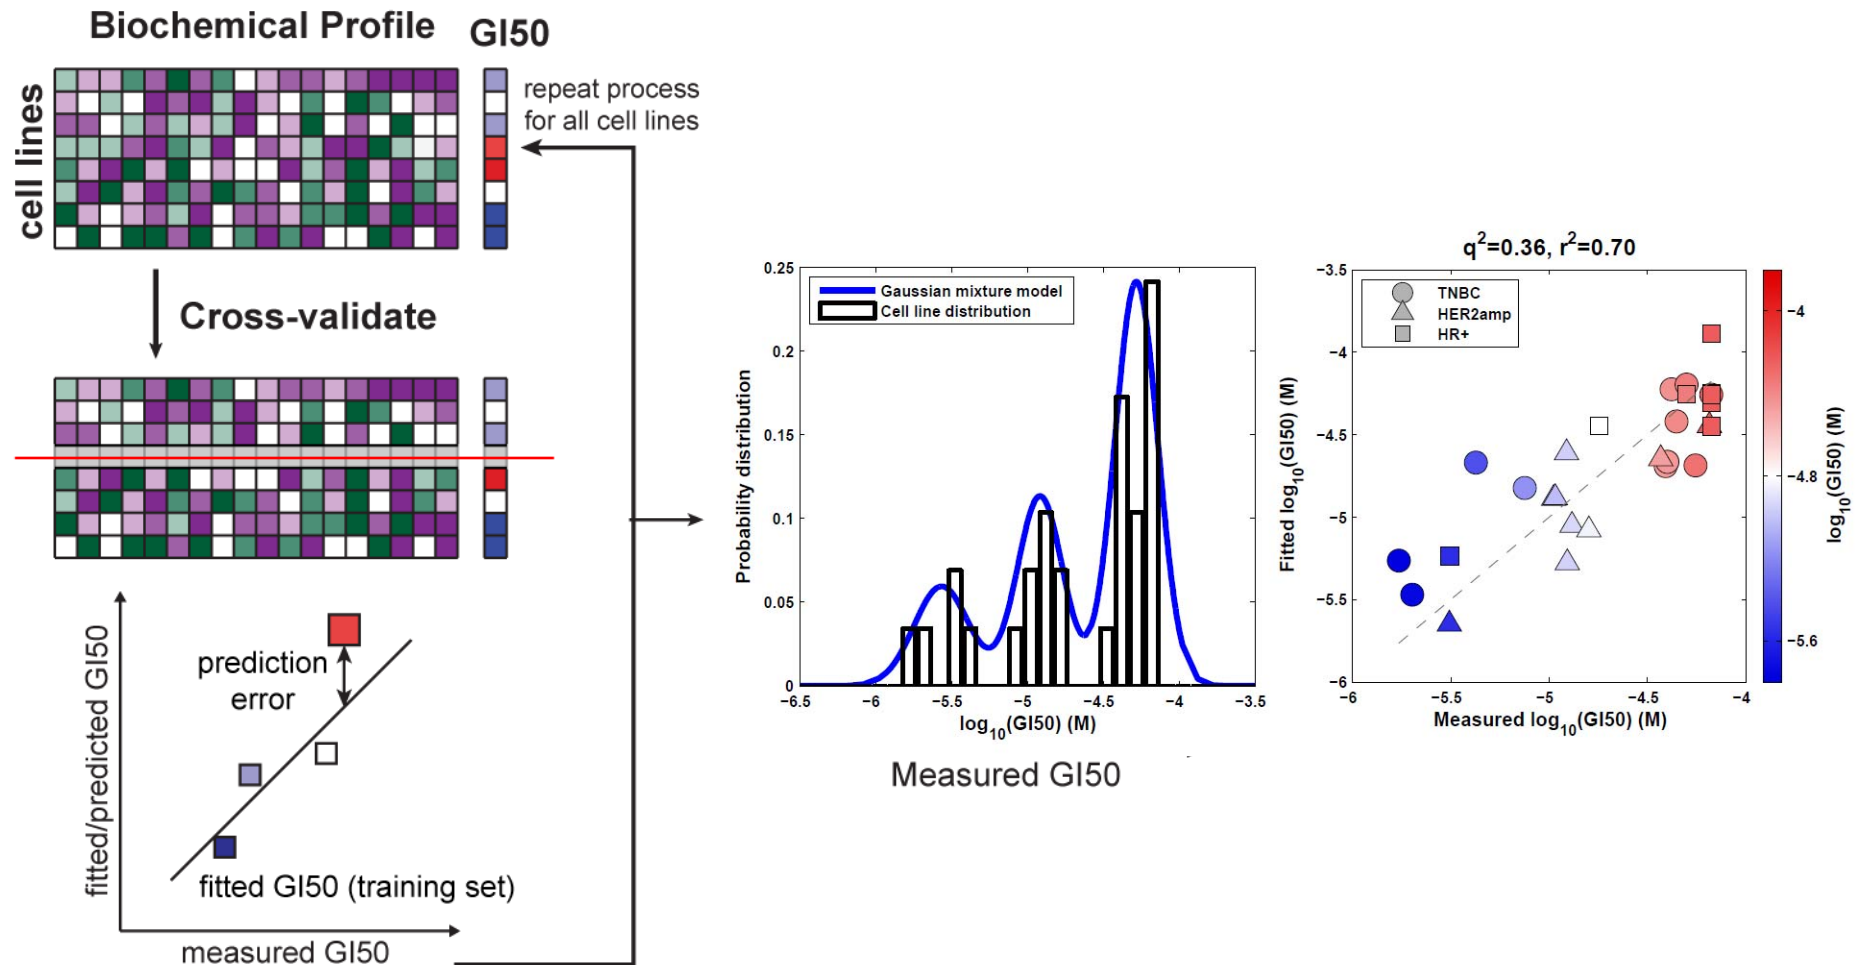

Cluster SCIII

Profile data contains information on drug sensitivity

Constructing a response predictor by PLSR

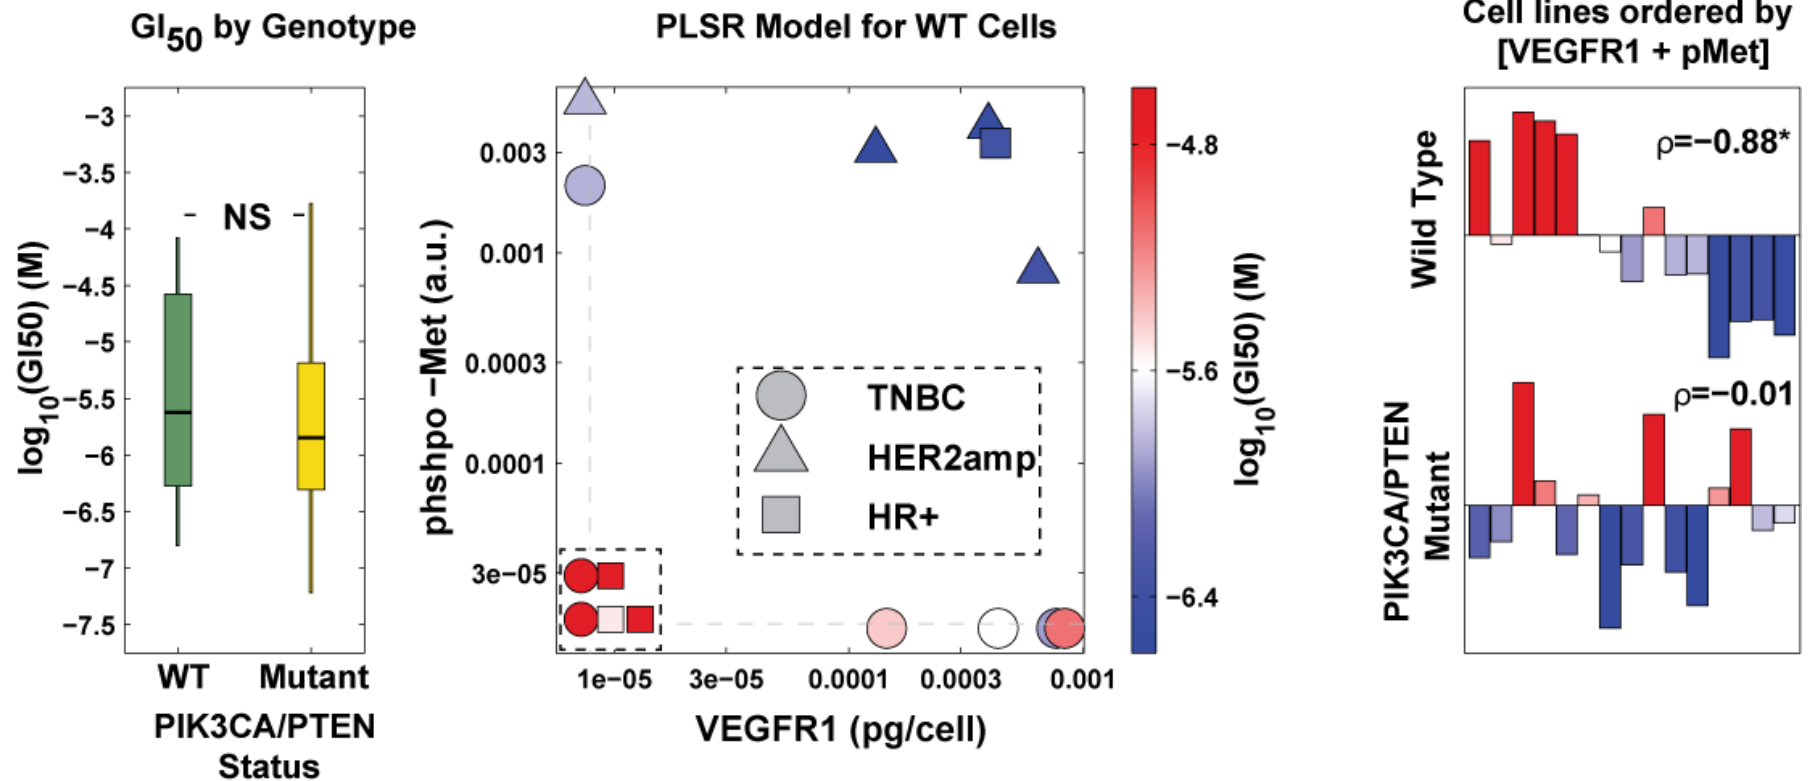

Response predictors for PI3K/Akt inhibitors

Response predictors for PI3K/Akt inhibitors: Receptors not Akt (or pAkt) are important variables

Building a hybrid predictor for Triciribine using biochemical and genomic data

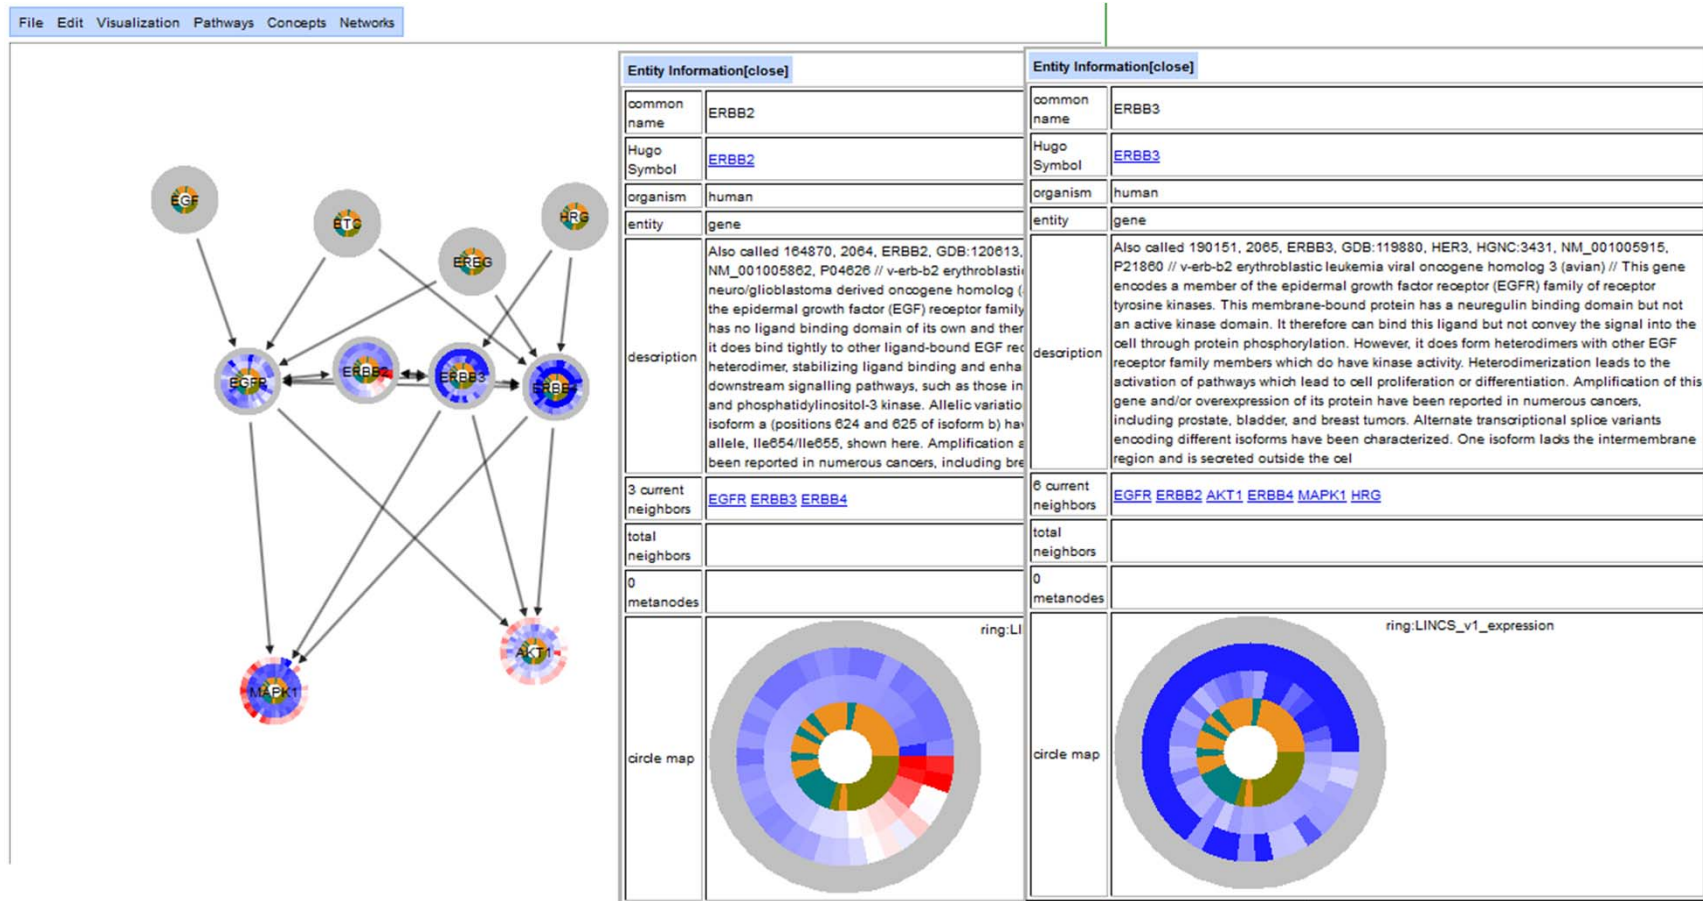

On-line browsing peturbagen response predictors

Conclusion: PI3K/Akt Response Predictors (posters 21-22)

Browsing LINCS Data and Models (poster 24)

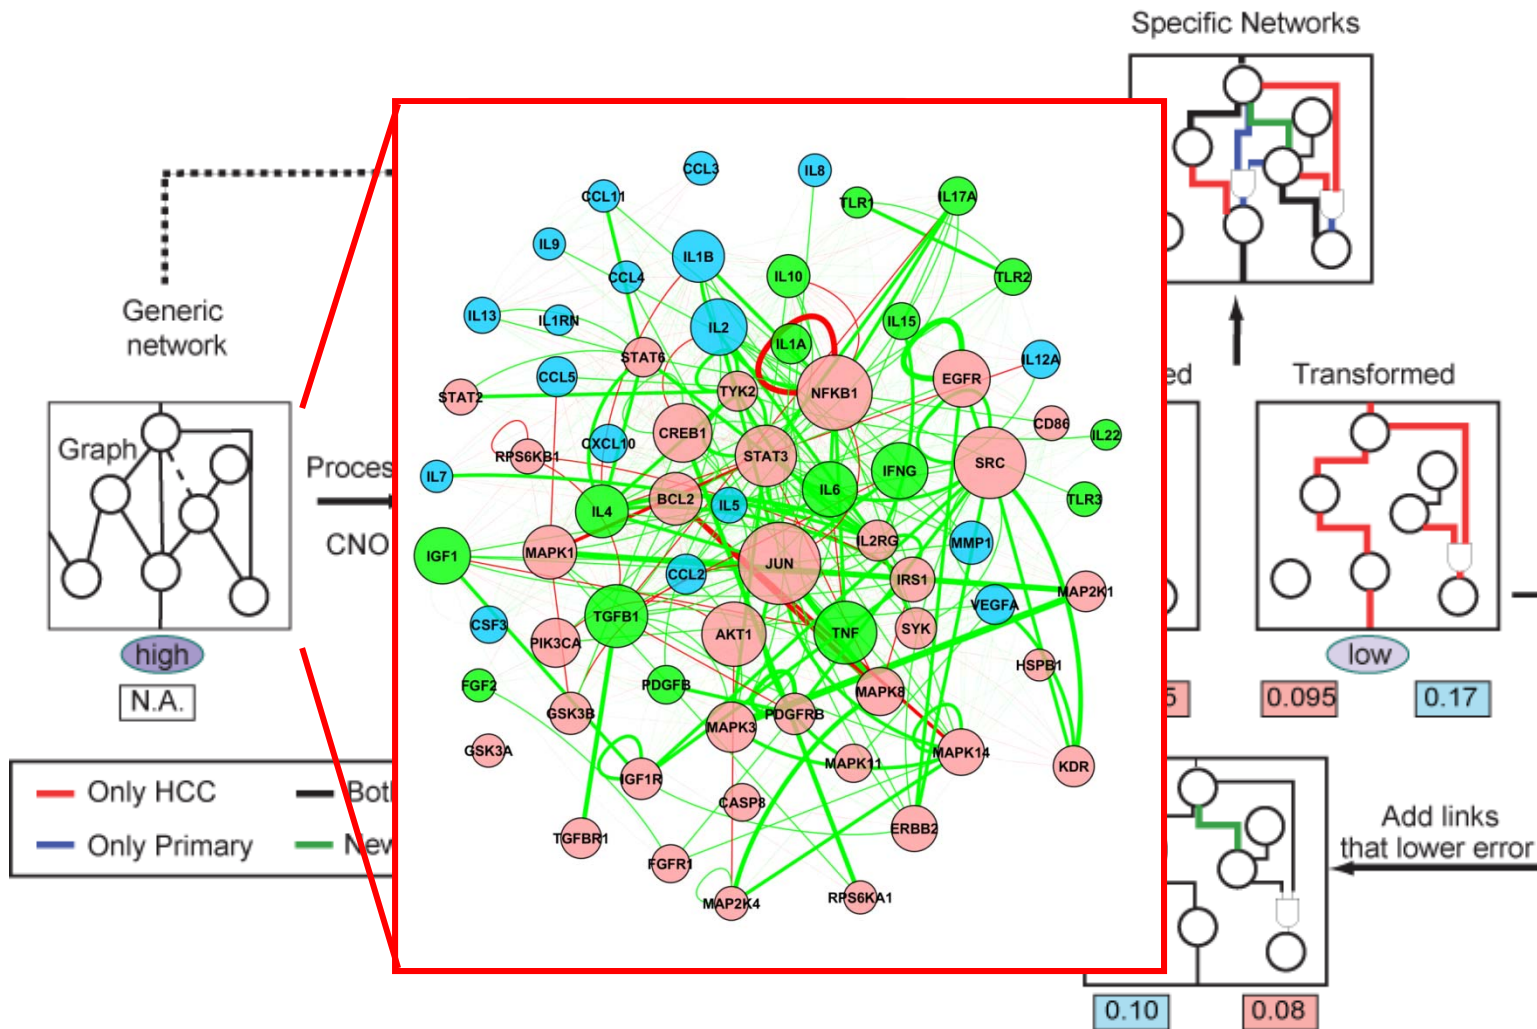

Hypothesis: canalization of drug responses across cell lines: many genotypes map to fewer phenotypes

A genetically canalized developmental system takes development to the same endpoint from many different genetic starting points – Waddington 1952.

Next steps: pathway models of perturbagen response

Modeling polypharmacology – a matrix perturbation of a complex network

Conflict Statement

- I disclose the following financial relationships*

Consultant for:

Merrimack Pharmaceuticals (pharmaceuticals)

Glencoe Software (image informatics)

Rarecyte Inc. (circulating tumor cells)

DVS Inc. (CyTOF mass spectrometry)

GE Healthcare (optical microscopy)

Current Grant support from:

Vertex Pharmaceuticals (liver cancer)

Boehringer Ingelheim (rheumatoid arthritis)

Novartis (Wnt signaling)

Past Grant support from:

Pfizer Inc.

Roche Inc.

- I will not discuss off label use and/or investigational drug use in my presentation.*
